TIER: TIER 1

THE PROBLEM

FRIDGEVISION: AUTOMATED SMART INVENTORY SYSTEM

A compact camera module installed inside the refrigerator captures photos automatically each day (or upon door closure).

Captured images are uploaded securely to a cloud storage folder for automated analysis.

Using computer vision (YOLOv8), the system detects, classifies, and counts all visible food items.

The inventory list is updated in real time — no manual input needed.

Users receive notifications for low-stock items, soon-to-expire products, and inventory summaries via the companion app or dashboard.

TECHNICAL APPROACH

- CV TECHNIQUE: OBJECT DETECTION

- MODEL: YOLOV8 (PRE-TRAINED, FINE-TUNED IF NEEDED)

- FRAMEWORK: PYTORCH OR ULTRALYTICS YOLOV8 REPO

- WHY YOLOV8: FAST, ACCURATE, AND DEPLOYABLE FOR REAL-TIME DETECTION.

DATA PLAN

- Sources: Grocery Store Dataset, Open Images, custom fridge photos.
- Size: 500–1,000 images.
- Labeling Tools: Roboflow or Labelling.
- Classes: Milk, Eggs, Vegetables, Bottles, Leftovers, etc.

SYSTEM DIAGRAM

- [Fridge Photo] → [YOLOv8 Detection] → [Item Count + Labels] → [Inventory List Output]

SUCCESS METRICS

- Primary Metric: Detection Accuracy (Target: 90%+)

• Secondary Metrics: Inventory completeness score = $(\text{Detected unique items} / \text{Actual unique items}) \geq 90\%$ *This measures how well our system captures the full set of items (not just accuracy per items)*

- Processing time < 1 second/image

- Usability score from user feedback

WEEK-BY-WEEK PLAN
